

# A ten-foot-deep deck can hold three distinct places.

My preferred starting point: a compact electric cooking bay, a real outdoor table, and a softer lounge at the living-room end.

A / RECOMMENDED STARTING POINT

## Why I favor A

It adds something you do not already have: a full outdoor dinner setting plus a place to linger. The grill is close to the kitchen end without occupying the sliding-door route.

## The geometry is promising

Use approximately 10'2" clear depth from the drawing-scaled section and 38.9 feet of length from the model. The deck serves both kitchen and living; it is not a 4-foot strip.

## Keep the grill electric

The standing project decision is all-electric. I have tested a portable electric grill envelope, with a separate cooking bay, rather than assuming gas piping or a permanent outdoor kitchen.

## The important restraint

Keep a route along the house and put the grill outside the roughly 5-foot roof overhang. Furniture and combustible materials must remain clear of the selected appliance.

# The dinner deck

Six at the table, four in the lounge, a separate cooking bay. All options share the same deck footprint and separated electric-grill bay.

OAK / OLIVE / LINEN / TERRACOTTA

A 7 × 2½ ft table seats six along its long sides. Slim chairs keep the depth workable. Olive cushions and warm terracotta connect to the lighter oak inside. Best for actual dinners; least flexible for a large standing group.

# The outdoor living room

A generous sofa, two lounge chairs and a small breakfast table. All options share the same deck footprint and separated electric-grill bay.

SAND / AUBERGINE / SAGE / CHARCOAL

A long aubergine sofa makes the deck feel like an extension of the living room. The small round table is for coffee or a light meal. Most relaxed visually; less useful for a full outdoor dinner.

# The flexible terrace

Two small tables that join for guests; loose chairs and open floor. All options share the same deck footprint and separated electric-grill bay.

LIMESTONE / OCHRE / BLUE / DUSTY ROSE

Two compact tables seat two each day to day. Join them and add end chairs for a six-person setting. Blue and ochre give this one more personality. The small planters stay at the lounge end. Most adaptable; requires moving furniture for a larger dinner.

# The grill works only if its whole operating zone fits.

The example is a portable Weber Lumin envelope, not a purchase selection. A built-in grill would need its own installation design and clearances.

This placement leaves about 27 inches from the grill’s back to the outer rail and a 36-inch route by the house. The cook stands between them. Preserve the entire cooking bay; do not fill its spare-looking space with planters or cushions.

Manufacturer sources: Weber Lumin US Owner’s Guide 77445, pp. 2–3; US product page for model 92280901 (26" W × 19" D closed). The plan shows a provisional cart footprint; the selected support may be larger. All-clearances fit remains conditional on the final product and materials.

## Manufacturer constraints

The Lumin US guide requires 24 inches from combustibile material, including above and below; it forbids combustibile overhead construction and built-in installation. A heat-resistant supporting surface is required. The stand/support and deck finish must be checked together.

## Electrical and use

The example is 120 V, 1,560 W (13 A). Provide an electrician-designed outdoor receptacle/circuit arrangement with suitable protection; keep the cord out of traffic and other high loads off the operating circuit.

## Resolve before choosing the exact spot

Confirm roof edge, rail material, wall/door positions, prevailing breeze, selected grill manual and permitted electrical routing. Retain access for grease-tray removal and cleaning. No floor cord crossing the sliders.

## Lighting for cooking

Use a small shielded task source for the cooking surface, on its own control. Keep the rail light soft; it is atmosphere and orientation, not sufficient light to judge food.
